Homework

Solutions to be uploaded by November 18.

Use Monte Carlo method to calculate volume (with uncertainty) of a solid constructed as an intersection of three cones inside the unit cube, with unit diameters and unit heights, and perpendicular axes:

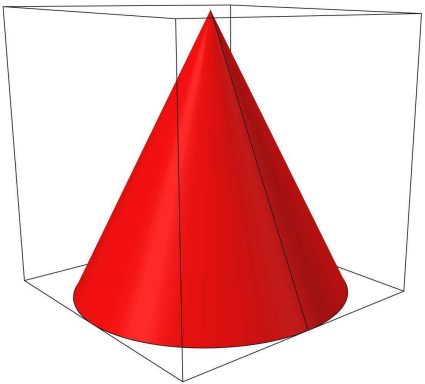

Unit cube $V_{\text{cube}} = 1$

Homework

Solutions to be uploaded by November 18.

Use Monte Carlo method to calculate volume (with uncertainty) of a solid constructed as an intersection of three cones inside the unit cube, with unit diameters and unit heights, and perpendicular axes:

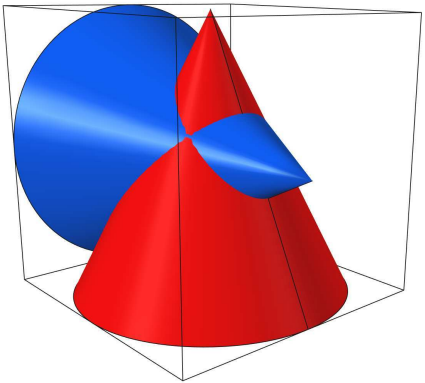

First cone

Homework

Solutions to be uploaded by November 18.

Use Monte Carlo method to calculate volume (with uncertainty) of a solid constructed as an intersection of three cones inside the unit cube, with unit diameters and unit heights, and perpendicular axes:

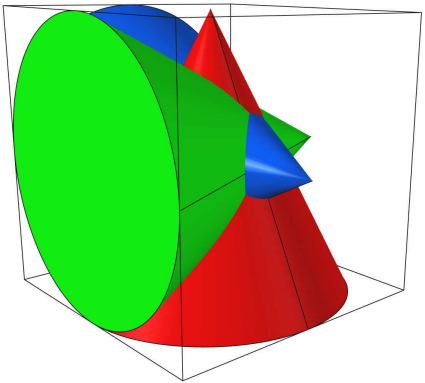

Second cone

Homework

Solutions to be uploaded by November 18.

Use Monte Carlo method to calculate volume (with uncertainty) of a solid constructed as an intersection of three cones inside the unit cube, with unit diameters and unit heights, and perpendicular axes:

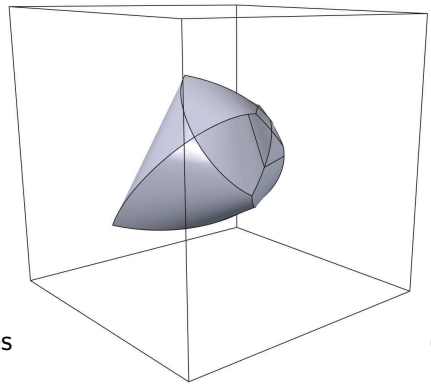

Third cone

Homework

Solutions to be uploaded by November 18.

Use Monte Carlo method to calculate volume (with uncertainty) of a solid constructed as an intersection of three cones inside the unit cube, with unit diameters and unit heights, and perpendicular axes:

Intersection of the three cones (points belonging to all three)
